

# LENDING CLUB CASE STUDY

## GROUP MEMBERS:-

1. Nitesh Kumar Nishant
2. Sanjeev Prasad

# Brief Introduction

- Lending club is the largest online loan marketplace, facilitating personal loans, business loans, and other lending services.
- Borrowers can easily access lower interest rate loans through a fast online interface.
- The aim of analysis is to find out the information about past loan applicants and find whether they 'defaulted' or not.

# Method to be followed

## ***Data Cleaning***

- Removing the null valued columns and unnecessary variables
- Then we will check null value % and remove the respective rows

## ***Understanding the data***

- To have better understanding of columns we will refer data dictionary which have been provide to us

## ***Univariate Analysis***

- We will be analyzing each column and plotting required graph.
- Distribution of each column

## ***Bivariate Analysis***

- Analyzing the two variables at same to get better understanding loan status
- We will try to fetch as more information as we can

## ***Segmented Analysis***

- Analyzing the continuous data column with respect to the categorical column

## ***Recommendation***

- After Doing above operation, we will finally come to our objective

# Finding Outliers using Box plot

***Removing outliers which are showing on the graph***

- ***The values after 95 percentile seems to be disconnected from the general distribution and also there is huge increase in the value for small quintile variation.***
- ***So, considering threshold for removing outliers as 0.95***

## Visualizing Categorical data

We are analyzing and visualizing only the defaulter data. So subsetting the data while plotting only for 'Charged Off' loan\_status for below plots

# Visualizing Categorical data

## Analyzing home\_ownership

*There were few values of "NONE" so we have replaced with others*

## Analyzing rate of interest with respect to the rate of interest of bins

## Analyzing columns b/w count & Interest Rate, and count & emp\_lengthth

# Analyzing columns like open\_acc, revol\_util, total\_acc, annual\_inc

## Analyzing columns between Count and Installment\_groups

The above chart shows us the probability of getting default.

## Analyzing columns loan\_amnt between term

## Conclusions

- Lending club should reduce the high interest loans for 60 months tenure, they are prone to loan default.
- Grades are good metric for detecting defaulters.
- Small business loans are defaulted more. Lending club should stop/reduce issuing the loans to them.
- Borrowers with mortgage home ownership are taking higher loans and defaulting the approved loans.
- Borrowers whose income is between 70k-80k and received rate of interest 21%-24% ,consider as threat of defaulters.
- Loan status history should be verified before sanction any loan.
- Lending club should avoid granting loan to lower salary employees.
- Financial crisis is also one of the reasons why loan get defaulted , They must have aware from this situation.
